Eyebrow aesthetic grafting

P. BOUHANNA M.D. (Paris) E. BOUHANNA M.D. (Paris)

1. INTRODUCTION:

Definitive female or male eyebrows thinning can be esthetically and definitively reconstructed with hair micrografts one by one. A schematic pattern for drawing the outline and understanding of the hair direction has been purposed.

2. OBJECTIVE:

The goal is to achieve the most natural design of the eyebrows according to the patient esthetic desire and the advices of the surgeon.

Two procedures will be described: the follicular unit extraction (FUE) and the follicular unit long hair (FUL).

3. METHODS:

- a. Design of the area to be transplanted according to a schematic pattern and the patient esthetic desire – even on patient which have been tatoored
- b. Nerve blocks and local cream anesthesia
- c. Follicular Unit Long hair (FUL) (1 hair) - no previous shaving of donor area
- d. Follicular Unit Extraction (FUE) (1 hair) - previous shaving of donor area
- e. Puncture with needle
- f. Hair harvested from the scalp will grow at the same rate as scalp hair
- g. Sometimes harvesting of body hair is possible

4. RESULTS:

- Choose the hair color, thickness and orientation
- Implantation parallel to the skin
- No bandage
- Very small crusts for 7 days
- Sometimes swelling for 3 days

5. CONCLUSIONS:

The reconstruction of the tail of eyebrows allows actually an esthetic and definitive result.

High patient satisfaction is achievable if patients are well selected and particularly among the psychological profile.
